

# URETHANE COATINGS

POLYURETHANE SPECIALISTS SINCE 1979

WaterKote® is a next generation waterborne polyurethane finish incorporating an extended open time that provides exceptional flow and levelling resulting in a polyurethane gloss film offering extremely hardwearing and long lasting protection to flooring and parquetry of all timber species.

As water is used as the alternative carrier to solvent, The WaterKote® Range emits low VOC'S (volatile organic compounds) and is therefore user and environmentally friendly but this advanced technology retains all the durable and hard wearing benefits of solvent based polyurethane.

This product is easy to use, providing excellent flow and leveling, which helps reduce lap marks and picture framing.

It has been tested on a wide range of Australian timber species, including Brush Box, Iron Bark, Black Butt, Jarrah, Spotted Gum, Cypress Pine, and oak varieties.

The product can be used with other Urethane Coatings products such as Timberseal, Monothane, and Duothane range, allowing you to achieve the system you want without limitations.

Its polyurethane dispersion technology utilizes the highest grade polymer, offering a high-build, durable coating that is resistant to scratches and chemicals.

The polyurethane film also provides UV resistance, and the coating develops high hardness, enabling the surface to return to service within 24 hours after film formation. Floor coverings, like rugs, can be placed on your floor after 3 days

(at 25°C and 50% RH, though this may vary with different conditions).

Additionally, the film is sandable, powdering up when using a low-rotational screen back at 150# to 220#, without clogging. The product is also known for its very low odour and low VOC content (<150g/L), making it a non-hazardous material according to GHS, which ensures it is easy and safe to use.
